

CI/CD

Ship on every commit.
Not once a quarter.

.NET ready

01

Git push

02

Green build

03

Production

Swipe for the **playbook** →

Stop deploying like it's 2014.

01

"Works on my machine"

Production is the first environment that actually counts.

02

One person knows the steps

If they're on leave, the release waits. That's a risk, not a process.

03

Friday deploys. Weekend rollbacks.

Manual releases feel fast — until they aren't.

04

Users find the bugs first

Tests that run "sometimes" are not a safety net.

CI/CD in one slide.

CI

Continuous Integration

Every push is built and tested automatically. Small merges. Fast feedback. Broken main is visible in minutes — not days.

CD

Continuous Delivery

Every green build is always release-ready. Deploy is a decision, not a project. Continuous Deployment ships it automatically.

THE POINT

It's not the YAML. It's a shorter, safer path from idea → users.

Keep the pipeline boring.

1

Commit

Small PR. Clear change. One reason to merge.

2

Restore & build

Same compiler, same flags, every time.

3

Test

Unit + integration. Red build never ships.

4

Scan

Secrets, vulnerabilities, quality gates.

5

Publish artifact

Build once. Promote the same package.

6

Deploy & verify

Staging → prod. Health checks. Easy rollback.

What you actually get.

Minutes, not weeks

A failed test on the PR is cheaper than a failed Friday night.

One path to prod

Dev, staging, and production follow the same pipeline. No snowflake servers.

Fewer war rooms

You know what shipped, who approved it, and which artifact is live.

Rollback is a click

Redeploy the last good artifact. Not a meeting. Not a hero.

5 rules that keep pipelines honest.

- 1 No merge without a green test gate.
- 2 Secrets live in a vault — never in YAML or git.
- 3 Build once. Deploy that same artifact everywhere.
- 4 Keep it fast. If it's over 10 minutes, people skip it.
- 5 Production always has a one-step undo.

A pipeline that doesn't overthink.

● ● ● CI.YML · PULL_REQUEST + MAIN

```
# every PR, every merge
→ dotnet restore
→ dotnet build --no-restore
→ dotnet test --no-build
→ dotnet publish -c Release
→ deploy the artifact
```

GitHub Actions

Azure Pipelines

GitLab CI

Jenkins

Pick one tool. Start this week. The command is the same.

Your first CI/CD win.

Don't automate everything.
Automate build + test on every PR.

That's 80% of the value.

This week

1. Green checks on every pull request.
2. Then add a deploy to staging.
3. Then production — with a rollback.
